Permutations: Given an array of n elements: $n \cdot (n-1) \cdot (n-2) \cdot \ldots \cdot 1 = n!$ $P_{n,k} = \frac{n!}{(n-k)!}, P_{n,n} = n!$

Combinations: In general we can "combine" n elements taking k at a time in $C_{n,k} = \frac{P_{n,k}}{k!} = \frac{n!}{(n-k)!k!} = \binom{n}{k}$

Multinomial Coefficients: n elements into $k(k \geq 2)$ groups s.t. group j gets n_i elements and $\sum_{j=1}^{k} n_j = n$. The n_1 elements in the first group can be selected in $\binom{n}{n_1}$, the second in $\binom{n-n_1}{n_2}$, the third in $\binom{n-n_1-n_2}{n_3}$ and so on for the k groups. Then: $\binom{n}{n_1} \cdot \binom{n-n_1}{n_2} \cdot \binom{n-n_1-n_2}{n_3} \cdot \ldots \cdot \binom{n_k}{n_k} = \binom{n}{n_1, n_2, \ldots, n_k}$

Probability union: If A_1, A_2, \ldots, A_n are disjoint events then $\Pr(A_1 \cup A_2 \cup \dots \cup A_n) = \Pr(\bigcup_{i=1}^n A_i) =$ $\Pr(A_1) + \Pr(A_2) + \dots + \Pr(A_n) = \sum_{i=1}^n \Pr(A_i)$

If the events are not disjoint:

Two events A_1, A_2 : $Pr(A_1 \cup A_2) =$ $Pr(A_1) + Pr(A_2) - Pr(A_1 \cap A_2)$ Three events: $A_1, A_2, A_3 : \Pr(A_1 \cup A_2 \cup A_3)$ $= \Pr(A_1) + \Pr(A_2) + \Pr(A_3) - \Pr(A_1 \cap A_2) \Pr(A_1 \cap A_3) - \Pr(A_2 \cap A_3) + \Pr(A_1 \cap A_2 \cap A_3)$

Conditional Probability: Pr(B|A) = $\frac{\Pr(A \cap B)}{\Pr(A)}$ and $\Pr(A|B) = \frac{\Pr(A \cap B)}{\Pr(B)}$ $Pr(A \cap B) = Pr(B|A) \cdot Pr(A)$ and $Pr(A \cap B) = Pr(A|B) \cdot Pr(B)$ In general: $Pr(A_1 \cap A_2 \cap ... \cap A_n)$ $= \Pr(A_1) \cdot \Pr(A_2|A_1) \cdot \ldots \cdot \Pr(A_n|A_1 \cap A_2 \cap$ $\ldots \cap A_{n-1}$

Independence: A, B are independent events if Pr(A|B) = Pr(A) and Pr(B|A) = Pr(B). Then: $Pr(A \cap B) = Pr(A|B) \cdot Pr(B) = Pr(A) \cdot Pr(B)$ $Pr(A \cap B) = Pr(B|A) \cdot Pr(A) = Pr(B) \cdot Pr(A)$ In general if A_1, A_2, \ldots, A_n are independent: $Pr(A_1 \cap ... \cap A_n) = Pr(A_1) \cdot ... \cdot Pr(A_n).$ Note that if $A \cap B = \emptyset$ then the two events are not independent. Note that if A, B are independent then A, B^c are also independent.

Conditionally Independent: A_1, A_2, \ldots, A_k are conditionally independent given B if, for every subset $A_{i_1}, \dots, A_{i_m} : \Pr(A_{i_1} \cap \dots \cap A_{i_m} | B) = \Pr(A_{i_1} | B) \cdot \dots \cdot \Pr(A_{i_m} | B).$

$$\begin{array}{l} \textbf{Bayes' Theorem:} & \Pr(B_i|A) \\ = \frac{\Pr(A|B_i) \cdot \Pr(B_i)}{\Pr(A)} = \frac{\Pr(A|B_i) \cdot \Pr(B_i)}{\sum_{j=1}^k \Pr(A|B_j) \cdot \Pr(B_j)} \end{array}$$

Uniform Distribution: $X = x, x \in$ $\{1, 2, \dots, k\}$ with all values x equally likely. The p.f. is $f_X(x) = \frac{1}{k} \{x | x = 1, 2, \dots, k\}$

Bernoulli Distribution: An event A happens with probability p: $f_X(x) = p \text{ if } x = 1, (1-p) \text{ if } x = 0$

Binomial: n Bernoulli trials repeated independently with probability of success p.

X := number of success in n trials.

$$x \in \{0, 1, \dots, n\}.$$

$$f_X(x) = \Pr(X = x)$$

$$= \begin{cases} \binom{n}{x} p^x (1-p)^{n-x} & x = 0, \dots, n \\ 0 & \text{o.w.} \end{cases}$$

$$\to X \sim \text{Bin}(n, p)$$

Quantile Function: X continuous r.v. $F^{-1}(p)$ is the quantile function of X for $0 \le$ $p \le 1.F^{-1}(p) = x \Rightarrow p = F(x).$

Joint Continuous Distributions: Joint p.d.f. given by $f_{X,Y}(x,y) = \Pr((X,Y) \in$ $A) = \iint f(x,y)dxdy$. To find the joint c.d.f. just integrate.

Negative-Binomial: Bernoulli als until r successes are observed. Xnumber of failures = $\{0, 1, \ldots\}$. probability of success. Pr(X = x)Pr(x failures before r successes) = Pr(x failures, r-1 successes, x+r-1 trials)) · Pr(one

success in last trial) =
$$\binom{x+r-1}{x}(1-p)^x p^r$$
.
 $f_X(x) = \begin{cases} \binom{x+r-1}{x}(1-p)^x p^r & x = 0, 1, 2, \dots \\ 0 & \text{o.w.} \end{cases}$

Hypergeometric: A box with A red balls and B blue balls. n balls are drawn without replacement. X := number of red balls $< \min(n, A)$. $\max(n - B, 0) < X < \min(n, A)$. Bounds: $\max(n - B, 0) \le x \le \min(n, A)$

$$f_X(x) = \begin{cases} \frac{\binom{A}{x} \cdot \binom{B}{n-x}}{\binom{A+B}{n}} & \text{bounds} \\ 0 & \text{o.w.} \end{cases}$$

Geometric: Negative binomial with r = 1 $f_X(x) = \begin{cases} (1-p)^x p & x = 0, 1, \dots \\ 0 & \text{o.w.} \end{cases}$

Poisson: Counts occurrences of an event. X is a Poisson r.v. with parameter λ (intensity) if the p.f. is $f_X(x) = \begin{cases} \frac{e^{-\lambda} \lambda^x}{x!} & x = 0, 1, 2, \dots \\ 0 & \text{o.w.} \end{cases}$ with $\lambda > 0$.

Cumulative Distribution Function: (c.d.f.) For any r.v. X the c.d.f. is given by $F(x) = \Pr(X \le x)$. Properties: If $x_1 < x_2 \Rightarrow$ $\{X \leq x_1\} \subset \{X \leq x_2\}$ and so $\Pr(X \leq x_1) \leq$ $\Pr(X < x_2) \Rightarrow F(x_1) < F(x_2)$ $\lim_{x\to-\infty} F(x) = 0$ and $\lim_{x\to\infty} F(x) = 1$ For a continuous r.v.: $F(x) = \Pr(X \le x) = \int_{-\infty}^{x} f(t)dt$ In general, $X \sim Unif[a, b] \Rightarrow$ $f(x) = \begin{cases} \frac{1}{b-a} & a \le x \le b \\ 0 & \text{o.w.} \end{cases}$ $F(x) = \begin{cases} 0 & x < a \\ \frac{x-a}{b-a} & a \le x \le b \\ 1 & x > b \end{cases}$

Marginal Distributions: In general for discrete r.v. $f_X(x) = \sum_{y} f(x,y)$ and $f_Y(y) = \sum_x f(x, y)$. In the case of 2 cont. r.v. $f_X(x) = \int_{-\infty}^{\infty} f(x, y) dy$ and $f_Y(y) =$ $\int_{-\infty}^{\infty} f(x,y)dx$. $f_X(x)$ is the marginal p.d.f. of $X. f_Y(y)$ is the marginal p.d.f. of Y.

Independence: Two r.v. are independent if they produce independent events: $\Pr(X \in A, Y \in B) = \Pr(X \in A) \cdot \Pr(Y \in B).$ This implies: $Pr(X \le x, Y \le y) = Pr(X \le y)$ $(x) \cdot \Pr(Y \le y) \Rightarrow F(x, y) = F_X(x) \cdot F_Y(y).$

Conditional Distributions: X, Y discrete r.v. with p.f. $f_X(x)$, $f_Y(y)$ and joint p.f. f(x,y). Then:

$$\begin{aligned} & \text{f.}(x,y). \text{ Then:} \\ & \text{Pr}(X=x|Y=y) = \frac{\Pr(X=x,Y=y)}{\Pr(Y=y)} = \frac{f(x,y)}{f_Y(y)}. \\ & g_X(x|y) = \begin{cases} \frac{f(x,y)}{f_Y(y)} & \forall x,y: f_Y(y) > 0 \\ 0 & \text{o.w.} \end{cases} \\ & \sum_x f_X(x|y) = \sum_x \frac{f(x,y)}{f_Y(y)} = \frac{1}{f_Y(y)} & \\ & \sum_x f(x,y) = \frac{f_Y(y)}{f_Y(y)} = 1. \\ & \text{In the continuous case } X,Y \text{ with joint p.d.f.} \\ & f(x,y) \text{ and marginal p.d.f.'s } f_X(x) \text{ and } f_Y(y): \\ & g_X(x|y) = \begin{cases} \frac{f(x,y)}{f_Y(y)} & f_Y(y) > 0 \\ 0 & \text{o.w.} \end{cases} \\ & \sum_{-\infty}^\infty g_X(x|y) dx = \int_{-\infty}^\infty \frac{f(x,y)}{f_Y(y)} dx = \int_{-\infty}^$$

$$\int_{-\infty}^{\infty} g_X(x|y)dx = \int_{-\infty}^{\infty} \frac{f(x,y)}{f_Y(y)}dx$$

$$\frac{1}{f_Y(y)} \int_{-\infty}^{\infty} f(x,y)dx = \frac{1}{f_Y(y)} \cdot f_Y(y) = 1$$

Distributions: Multivariate X_1, X_2, \ldots, X_n have a joint discrete distribution if (X_1, \ldots, X_n) can have only a countable sequence of values in \mathbb{R}^n . The joint p.f. is $f(x_1,...,x_n) = Pr(X_1 = x_1,X_2 =$ $x_2, \ldots, X_n = x_n$). X_1, X_2, \ldots, X_n have a joint continuous distribution if there exists f such that $f((X_1,\ldots,X_n)\in\mathcal{C})=$ $\int \cdots \int f(x_1,\ldots,x_n)dx_1\ldots dx_n$.

 $f(x_1,\ldots,x_n)$ is $_{
m the}$ joint p.d.f. $\frac{d^n F(x_1,\ldots,x_n)}{dx_1\ldots dx_2}.$ and $f(x_1, \ldots, x_n) =$ $F(x_1, \dots, x_n) = \Pr(X_1 < x_1, X_2 < x_1, X_2 < x_2 < x_2 < x_2 < x_3 < x_3 < x_3 < x_4 < x_2 < x_2 < x_3 < x_3 < x_3 < x_3 < x_4 < x_4 < x_5 <$ $x_2,\ldots,X_n\leq x_n$).

Marginal Distributions: $X_1, ..., X_n$ are cont. r.v. with joint p.d.f. $f(x_1,\ldots,x_n)$. Then the marginal distribution of $X_1 = f_{X_1}(x_1) =$ $\int_{-\infty}^{\infty} \cdots \int_{-\infty}^{\infty} f(x_1, x_2, \dots, x_n) dx_2 dx_3 \dots dx_n.$ $F(x_1)$ is the marginal c.d.f. of X_1 and $F(x_1) = \Pr(X_1 \le x_1) = \Pr(X_1 \le x_1, X_2 < x_1)$ $\infty,\ldots,X_n<\infty$).

Conditional Distribution: $f(x_1,\ldots,x_n)$: joint p.d.f. of x_1,\ldots,x_n ; $f_0(x_1,\ldots,x_k)$: joint p.d.f. of x_1,\ldots,x_k with k < n. Then $\forall x_1, \ldots, x_k$ such that $f_0(x_1,\ldots,x_k) > 0$ the conditional p.d.f. of X_{k+1}, \ldots, X_n given $X_1 = x_1, \ldots, X_k = x_k$ is $g(x_{k+1},...,x_n|x_1,...,x_k) = \frac{f(x_1,...,x_n)}{f_n(x_1,...,x_k)}$

Functions of one R.V: Consider a r.v. X cont. with p.d.f. $f_X(x)$. Assume we are interested in Y = r(X) with r a function. What is the dist. of Y? Let $G_Y(y) = \Pr(Y \leq y)$ be the c.d.f. of Y: $G_Y(y) = \Pr(Y \leq y) =$ $Pr(r(X) \le y) = \int f(x)dx\{x : r(x) \le y\}.$ To get the p.d.f. of Y take derivatives: $g_Y(y) =$ $\frac{dG_Y(y)}{dy} = \frac{1}{2}y^{-\frac{1}{2}}$. For continuous r.v. such that Y = r(X) with r differentiable and oneto-one: $g_Y(y) = f_X(r^{-1}(y)) \left| \frac{d}{dy} r^{-1}(y) \right|$.

Functions of two or more **R.V.s:** Discrete case: X_1, X_2, \dots, X_n r.v. with joint p.f. $f(x_1, \ldots, x_n) = f(x_1, \ldots, x_n)$ $r_1(X_1,\ldots,X_n)$ $\ldots Y_m = r_m(X_1,\ldots,X_n).$ Let $A := \{(x_1, \ldots, x_n) := \text{ such that } y_1 = x_1 \}$ $r(x_1, ..., x_n) ... y_m = r(x_1, ..., x_n)$. Then: $g(y_1,\ldots,y_m) = \Pr(Y_1 = y_1,\ldots,Y_m = y_m) =$ $\sum f(x_1,\ldots,x_n).$

Continuous case: X_1, X_2, \dots, X_n cont. with joint p.d.f. $f(x_1, \ldots, x_n)$.

Let
$$Y = r(X_1, ..., X_n) \rightarrow A_y = \{(x_1, ..., x_n) \text{ s.t. } r(x_1, ..., x_n) \leq y\}$$

Then the c.d.f. of Y is $G(y) = \Pr(Y \leq y) = \Pr(r(X_1, ..., X_n) \leq y) = \int_{A_y} ... \int f(x_1, ..., x_n) dx_1 dx_2 ... dx_n$. The density/p.d.f. of Y is $g(y) = \frac{dG(y)}{dy}$. If $Y = a_1X_1 + a_2X_2 + b \Rightarrow g(y) = \int_{-\infty}^{\infty} f\left(\frac{y - a_2x_2 - b}{a_1}, x_2\right) \left|\frac{1}{a_1}\right| dx_2$

 $\begin{array}{llll} \textbf{Transformations:} & X_1, \dots, X_n & \text{cont.} \\ \text{r.v.'s with joint pdf } f(x_1, \dots, x_n). & \text{Let } Y_1 = \\ r_1(X_1, \dots, X_n), \dots, Y_n & = & r_n(X_1, \dots, X_n). \\ \text{To find the joint pdf of } Y_1, \dots, Y_2 & \text{for a one-to-one differentiable transformation } x_1 & = & s_1(y_1, \dots, y_n), \dots, x_n & = \\ s_n(y_1, \dots, y_n) & \to & \text{The joint pdf of } Y_1, \dots, Y_n \\ \text{is } g(y_1, \dots, y_n) & = & f(s_1, \dots, s_n) |J| & \text{where} \\ J & = & \det \begin{bmatrix} \frac{ds_1}{dy_1} & \dots & \frac{ds_1}{dy_n} \\ \vdots & \ddots & \vdots \\ \frac{ds_n}{dy_1} & \dots & \frac{ds_n}{dy_n} \end{bmatrix} \\ \end{array}$

Linear Transformations: Suppose that $\vec{X} = \begin{pmatrix} X_1 \\ \vdots \\ X_n \end{pmatrix}$ and $\vec{Y} = \begin{pmatrix} Y_1 \\ \vdots \\ Y_n \end{pmatrix} = A\vec{X}$ (with

A a non-singular matrix). Then $\vec{X}=A^{-1}\vec{Y}$ and $g_Y(y)=f_X(A^{-1})\cdot\frac{1}{|\det A|}$

Markov Chains: A sequence of r.v.'s X_1, X_2, \dots is a stochastic process with discrete time parameter. X_1 is the initial state and X_n is the state at time n. A stochastic process with discrete time parameter is a Markov chain if for each n, $Pr(X_{n+1} < b|X_1 = x_1, X_2 =$ $x_2, \dots, X_n = x_n$) = $\Pr(X_{n+1} \le b | X_n = x_n)$. A Markov Chain is finite if there are finite possible states. Then: $Pr(X_1 = x_1, ..., X_n =$ $(x_n) = \Pr(X_1 = x_1) \Pr(X_2 = x_2 | X_1 = x_2)$ x_1)... $\Pr(X_n = x_n | X_{n-1} = x_{n-1})$. Transition distributions: When a MC has k possible states then it has a transition distribution where there exist probabilities p_{ij} for i, j = 1, ..., k such that $\forall n : \Pr(X_{n+1} = j | X_n = i) = p_{ij}$ and if $\Pr(X_{n+1} = j | X_n = i) = p_{ij} \forall n$ then it is a stationary transition distribution. In this case

there is a matrix s.t. $\sum_{j=1}^{k} p_{ij} = 1, \forall i$:

$$P = \begin{bmatrix} p_{11} & \dots & p_{1k} \\ \vdots & \ddots & \vdots \\ p_{k1} & \dots & p_{kk} \end{bmatrix}$$

Transition of several steps: $P^m = P \cdot ... \cdot P$ Just exponentiate P and then find the resulting p_{ij} .

Expectation:

 $E(X) = \int_{-\infty}^{\infty} x f(x) dx$

$$E(X) = \sum_{x} x f(x) = \sum_{x} \Pr(X = x) \qquad \text{If } X \text{ and } Y \text{ are } E(X) = \sum_{x} x f(x) = \sum_{x} \Pr(X = x) \qquad \text{If } X \text{ and } Y \text{ are } E(Y) = \sum_{x} x f(x) \text{ is the p.d.f. of } X : \qquad \text{Correlation:} E(Y) = \sum_{x=0}^{\infty} r(x) f(x) dx \qquad \text{Corr}(X, Y) = p = 2 Cov(X, Y) = p = 2 Cov(X,$$

Variance:

S.D.:
$$\sigma = \sqrt{V(X)}$$

 $V(X) \geq 0!!!$
 X discrete: $V(X) = \sum_{X} (x - \mu)^2 f(x)$
 X cont.: $V(X) = \int_{-\infty}^{\infty} (x - \mu)^2 f(x) dx$
 $V(X) = E[(X - \mu)^2] = E(X^2) - \mu^2$
 $V(X) = 0 \iff \Pr(X = c) = 1 \text{ with } c \text{ constant}$
 $a, b \text{ constant: } V(aX + b) = a^2 V(X)$
 $X_1, \dots, X_n \text{ independent: } V(X_1 + \dots + X_n) = V(X_1) + \dots + V(X_n)$
Bernoulli: $V(X) = p(1 - p)$
Binomial: $V(X) = np(1 - p)$

 $V(X) = E[(X - \mu)^x]$ with $\mu = E(X)$

Negative Binomial: $V(X) = \frac{r(1-p)}{p^2}$

Geometric: $V(X) = \frac{1-p}{n^2}$

Poisson: $V(X) = \lambda$

Covariance:
$$Cov(X,Y) = E[(X - \mu_X)(Y - \mu_Y)] = E(XY) - \mu_X \mu_Y$$

Discrete: $E(XY) = \sum_{x} \sum_{y} xyf(x,y)$

Cont:
$$E(XY) = \int_{-\infty}^{\infty} \int_{-\infty}^{\infty} xyf(x,y)dxdy$$

If X and Y are independent: $Cov(X,Y) = 0$
Correlation:
 $Corr(X,Y) = \rho(X,Y)$
 $= \frac{Cov(X,Y)}{\sqrt{V(X)}\sqrt{V(Y)}} = \frac{Cov(X,Y)}{\sigma_X\sigma_Y}$
Schwarz Ineq: $[E(UV)]^2 \le E(U^2)E(V^2)$
 $[Cov(X,Y)]^2 \le V(X) \cdot V(Y)$
 $-1 \le \rho(X,Y) \le 1$
Indep: $Cov(X,Y) = 0$ and $\rho(X,Y) = 0$
 X r.v. w/ finite variance and $Y = aX + b$ s.t. $a \ne 0, a, b$, constant, then $a > 0 \rightarrow \rho(X,Y) = 1$ and $a < 0 \rightarrow \rho(X,Y) = 1$
 $X = 0$ $X =$

Discrete: $\mu_X = E(X) = \sum_{x} \sum_{y} x f(x, y)$

Discrete: $\mu_Y = E(Y) = \sum_{x} \sum_{y} y f(x, y)$

Conditional Expectation:

Def:
$$E(Y|X=x)$$

Cont: $=\int_{-\infty}^{\infty}yg_{Y}(y|x)dx$
Disc: $=\sum_{y}yg_{Y}(y|x)$
 $E(Y|X=x)$ is a function of x not y
 $h(x)=E(Y|x)$: $h(x)$ is not a random variable
 $E(Y|X)\neq E(Y|X=x)$
 $E(Y|X)=h(X)\rightarrow h(X)$ is a r.v.
 $E(Y|X=x)=h(x)\rightarrow h(X)$ is not a r.v.
 $E(E(Y|X))=E(Y)$

Conditional Variance:

$$V(Y|X = x) = E(Y^{2}|X = x) - [E(Y|X = x)]^{2}$$

 $E(Y^{2}|X = x) = \int_{-\infty}^{\infty} y^{2}g(y|x)dy$

Standard Normal Distribution:

$$X$$
 has standard normal dist. with $\mu=0$ and $V=0, X\sim N(0,1)$ if: p.d.f.: $\phi(x)=\frac{1}{\sqrt{2\pi}}\exp\left(\frac{-x^2}{2}\right)$ c.d.f.: $\Phi(x)=\Pr(X\leq x)$
$$=\int_{-\infty}^x\phi(u)du=\int_{-\infty}^x\frac{1}{\sqrt{2\pi}}\exp\left(\frac{-u^2}{2}\right)du$$
 $\phi(x)=\phi(-x)$
$$\Phi(x)=\Pr(X\leq x)=1-\Phi(-x)$$
 $\Phi^{-1}(p)=-\Phi(1-p)$

Linear combo of r.v.
$$X_1,\ldots,X_n$$
 with $X_i\sim N(\mu_i,\sigma_i^2)$ then:
$$\sum_{i=1}^n X_i = X_1 + \ldots + X_n \sim N(\sum_{i=1}^n \mu_i,\sum_{i=1}^n \sigma_i^2)$$
 Generally:
$$\sum_{i=1}^n a_i X_i = N(\sum_{i=1}^n a_i \mu_i,\sum_{i=1}^n a_i^2 \sigma_i^2)$$
 Linear combo of r.v.'s: $E(\bar{X_n}) = \mu$
$$V(\bar{X_n}) = \frac{\sigma^2}{n}$$
 If Y is a linear combo of r.v.'s: $Y \sim N(\mu,\sigma^2)$ To find $\Pr(a < Y < b)$, use $Z = \frac{Y - \mu}{\sigma}$
$$\Rightarrow Z \sim N(0,1)$$
 Markov Inequality: X r.v., $\Pr(X \ge 0) = 1$, then: $\forall t > 0 : \Pr(X \ge t) \le \frac{E(X)}{t}$ Chebyshev's Inequality: X r.v. w/ $V(X) \Rightarrow \forall t > 0 : \Pr(X - E(X)) \ge t) \le \frac{V(X)}{t^2}$

Central Limit Theorem:

 $X \sim N(\mu, \sigma^2) \to Z = \frac{X - \mu}{\sigma}$

 $F(x) = \Pr(X \le x) = \Phi(\frac{x-\mu}{2})$

Also: $F^{-1}(p) = \mu + \sigma \Phi^{-1}(p)$

Then: $Z \sim N(0,1)$ and cdf of X is

 X_1, \ldots, X_n i.i.d. sample from distribution with mean μ and variance σ^2 . For each $x(-\infty < x < \infty)$:

So for $\bar{X_n}$: $\Pr(|\bar{X_n} - \mu| > t) < \frac{V(\bar{X_n})}{2} = \frac{\sigma^2}{2}$

$$\Rightarrow \lim_{n \to \infty} \Pr\left(\frac{\bar{X_n} - \mu}{\frac{\sigma}{\sqrt{n}}} \le x\right) = \Phi(x)$$

with $\Phi(x) =$ the c.d.f. of a standard normal

Other Stuff:

$$\begin{split} \sum_{i=1}^{n} i &= \frac{n(n+1)}{2}, \sum_{i=1}^{n} i^2 = \frac{n(n+1)(2n+1)}{6} \\ \sum_{i=0}^{n} c^i &= \frac{c^{n+1}-1}{c-1}, c \neq 1; \sum_{i=0}^{\infty} c^i = \frac{1}{1-c} \\ \frac{d}{dx}(a^x) &= \ln a \\ (fg)' &= f'g + fg' \\ \left(\frac{f}{g}\right)' &= \frac{f'g - fg'}{g^2} \\ \frac{d}{dx}(f(g(x))) &= f'(g(x))g'(x) \\ \frac{d}{dx}(e^{g(x)}) &= g'(x)e^{g(x)} \\ \frac{d}{dx}(\ln g(x)) &= \frac{g'(x)}{g(x)} \\ \int \frac{1}{x} dx &= \ln |x| + c, \int \frac{1}{ax+b} dx = \frac{1}{a} \ln |ax+b| + c \\ \int e^u du &= e^u + c, \int a^u du &= \frac{a^u}{\ln a} + c \\ \int_{g(a)}^{b} f(g(x))g'(x) dx &\Rightarrow u &= g(x) \Rightarrow \\ \int_{g(a)}^{g(b)} f(u) du \\ \int u dv &= uv - \int v du \end{split}$$
